Abstract

A Meta analytical review investigated the study habits and academic achievement of school and college students. In this study the sample consists of twenty seven reviews based on study habits and academic achievement/performance. The sample of the review based on inclusion criteria such as study habits and academic achievement. The review was collected by following details such as title of the study, Name of the author, Sample of the study, correlation Value and findings of the study. The Meta analysis is on the relationship between study habits and academic achievement. The main aim of the study is to find the fixed effects, random effects model values, Heterogeneity and forest plots. A Meta analysis of research paper was formed the conclusion.

Keywords: Study habits, Academic achievement, Meta analysis

Introduction

In 21st century highly competitive world, students face a variety of academic problems such as exam stress, attending classes and the inability to understand the subject (Manimozhi and Srinivasan, 2018) for that problem students can maintain the different behaviour to achieve the academic field. Continuously a student following the good study habit means students can improve the interest, reducing the exam stress and easily understanding the subject. Achievement is not based on ones ‘how much ones study but it’s really based how ones study’, so performance of pupils achievement depend on ones studying habits. Study habits can play vital role to get better performance in academic and everywhere.

Background of the Study

Education plays an essential position in the development of a learner. In 21st century learners using more than type of way to learn the things, especially student’s academic achievement is measured by one’s ability to learn/study. The efficient and ability of the study is based on students study habits. A academic performance is depends on the study habits of students, so teachers and parents to motivate the pupils improve the study habits.

More factors affect the ones study habits such as social life, health condition, interest in the topic and ultimate goal and so on. Positive factor can raise the study habits and improve the student’s academic achievement, negative factor shrink the study habits and reduce the students performance in academically.

According to Crow and Crow (1956) Positive attitude, proper physical condition and balanced emotional states are important factors influencing study habits.

According to Good (1973) study habits as: The student’s way of study whether systematic, efficient or inefficient etc.
According to Patel (1976) study habits comprise the positive factors such as home environment and planning of work, reading and note taking habits, planning of subjects, habits of concentration, preparation for examination, general habits and attitudes and school environment.

According to Manimozhi and Srinivasan (2018) academic performance means evaluation of enlightening ability through the examination and assessment, the academic performance is mostly depends on ones interest of the study behaviour.

From the above statements, researchers can quite a few common points about study habits. According to these statements there are key points:

• Way of study is a study habits
• Positive factors influence the study habits to increase the achievement
• Behaviour of pupils to prepare the exam

Researchers on the other hand, find the relationship of academic performance and study habits. This research papers compares thirty studies using meta-analysis approach and identify the relationship of studies and fixed effect, random effect and heterogeneity.

Objectives of the Study

The objectives of the studies are

• To collect the literature review based on Study habits and Academic achievement/ performance.
• To classify the statistical values.
• To discover the fixed effect, random effect and heterogeneity values using by Meta analysis software.
• To find the relationship between and Study habits and Academic achievement / Academic performance.

Hypothesis of the Study

There is no significant relationship between Study habits and Academic achievement / Academic performance.

Operational Definition of Key Terms

Following are the operational definition of key terms,

Study Habits: Way of behaving one uses to help them study and learn continuously.

Academic Achievement/ Performance: Appraisal of learning and academic ability through test and examination.

Meta Analysis: Synthesis the various interconnected studies to conclude the common elucidation.

Population of the Study

The population of the present study is the Emotional intelligence and academic performance research papers in Eric, Google scholar and science direct. The sample selection process is included in the below fig.1.

Relevant studies in database (n=204)

Article included in further details (n=15)

Artie included in further details (n=30)

Inclusion Criteria such as quantitative study, sample, statistical analysis and (correlation)

Figure 1: The Process of Studies Inclusion and Exclusion of Meta-analysis

Sample of the Study

The sample consists of 30 studies based on study habits and academic performance. A purposive sampling technique is used for this study. The features of the studies noted in the below table.

There is a positive correlation between study habits and academic success GPA,

There is significant positive relationship between Study Habits and Academic Achievement.

There is no significant correlation between study habits and academic achievement.

There is a significant week and positive relation between the Students Study Habits and their Academic Performance.

The overall Correlation revealed a highly significant relation between study habits and academic performance.

There is a significant positively relation between Study Habits and Academic Achievement.

Overall study habits has significantly high positive correlation with academic performance, so better study habits lead to better academic performance.

There is significant positive relationship between Achievement in Chemistry and Study Habits.

There is a significant relationship between academic achievement in mathematics and study habits.

There is no significant relationship between Study Habits and Academic Achievement.

There is positive significant relationship between study habit and student science achievement.

There is significant relationship between positive effect on study habit and academic performance.

0.298

There is no significant correlation between academic achievement and Study habits of secondary school socially disadvantaged students of Panchkula

Methodology

Quantitative method was used especially Meta analysis method was used. Therefore the methodology adopted in this study is quantitative approach.

Data Analysis

The sample selection was based on the study habits and academic performance research papers. Each review was together and correlation values were tabulated for Meta analysis. Finally numbers of sample & correlation values are considered for Meta analysis. Table-2 shows Meta analysis of reviews.

### Table 2: Meta Analysis Fixed, Random and Heterogeneity Value

Confidence Interval: Hypothesis Testing

The heterogeneity degree values conclude whether the analysis is carry out with a random effects model or fixed effects model. The inconsistency index (I2) value was used to assess the heterogeneity degree value, such as low, moderate, or high according to values of 25%, 50%, and 75%, respectively.

According to Manimozhi and Srinivasan generally Meta analysis based on two effect model such as fixed effect and random effect model. If inconsistency index value is less than or equal to 25% means the studies are homogenous and the inconsistency index value is higher than or equal to 75% means the studies are heterogeneity.

Figure 2: The Forest Plot of Study Habits and Academic Achievement through Fixed Model

Figure 3: The Forest Plot of Study Habits and Academic Achievement through Random Model

Manimozhi and Srinivasan explained the confidence level of 95% the p-value is smaller than .05. In traditional terminology, this means that the meta-analytic effect is statistically significant. If the aim of the meta-analysis is to test the hypothesis that there is an effect, then the null hypothesis can be rejected and the alternative hypothesis is accepted.

From the above Fig 2 shows the fixed model effect of study habits and academic achievement and Fig.3. Shows the study habits and academic achievement through the random effect model.
From this table 2, $I^2 = 98.272$ ($I^2 \geq 75\%$) then the value is greater than of 75%, so heterogeneity is very high, and researcher use a random effect model for meta-analysis. In this study P value is 0.000 is less than 0.05 at 95% confidence level, this means that the null hypothesis rejected. Hence there is a significant relationship between study habits and academic achievement.

From the above figure (2) the correlation value of study habits and academic achievement according to the fixed model pooled results was 0.519 and the lower limit and upper limit was 0.503-0.534 at 95% confidence interval.

From the above figure (3) the correlation between study habits and academic achievement according to the random effect model pooled results was 0.530 and the lower limit and upper limit was 0.372-0.658 at 95% confidence interval.

Conclusion

The purpose of this study was to make an analysis of the relationship between study habits and academic achievement by using a meta-analysis. The results of the study show that the studies study habits and academic achievement significantly relationship with each other.

Some of the contributions this study has identified are as follows:

- Forest plot of correlation between study habits and academic achievement through fixed model
- Forest plot of correlation between study habits and academic achievement through random effect model.
- Heterogeneity value suggests that the studies in this meta-analysis cannot be considered to be studies of the same population.

From this study revealed, there is a significant relationship between student’s academic achievement and study habits. study habits is varied from students to students, but continuously following the study habits is improve the academic performance.
