## Definition

A graph $G$ consists of a pair $(V, E)$, where $V$ is a non-e mpty finite set whose elements are called vertices(points) and $E$ is a set of unordered pair of distinct elements of $E$ are called edges (line or link) of thegraph G.

## Example

(A graph with 4 vertices and 6 edges)
$V_{1}, V_{2}, V_{3}, V_{4}$ are vertices
$e_{v} e_{2}, e_{3}, e_{4}, e_{5}, e_{6}$ are edges.

## Definition

The degree of the vertex $v$ in a graph $G$ is the number of the edges incident with $V$. The degree of the vertex $v$ is denoted by $\operatorname{deg}(v)$ or $d(v)$.

The minimum degree and the maximum degree of a graph of $G$ are usually denoted by special symbol \& $(\mathrm{G})$ and $\Delta(\mathrm{G})$ respectively.

## Example

## Definition

A graph that has neither self - loops nor parallel edges is called a simple graph.

## Example

## Definition

A graph $G_{1}$ is said to be a subgraph of graph $G$ if all vertices and allthe edges of $G_{1}$ are in $G$ and each edge of $G_{1}$ has the same end vertices in $G_{1}$ as in $G$.

## Example

G

$\mathbf{G}_{1}$

## Definition

A graph $G$ is said to be connected. If there is at least one path between every pair of vertices in $G$. Otherwise G is disconnected.

## Example

Connected

disconnected

## Definition

A disconnected graph consists of two or more connected graphs. Each of these connected sub graph is called component.

## Definition

A simple graph in which there exists an edge between every pair of vertices is called complete graph. The complete graph with $n$ - vertices is denoted by $\mathrm{K}_{\mathrm{n}}$.

## Example

## Definition

A graph G is called bipartite if its vertex set $V$ can be decomposed into disjoint subsets $V_{1}$ and $V_{2}$ such that every edge in $G$ join a vertex in $V_{1}$ with a vertex in $V_{2}$.

## Example

## Definition

Two graphs $G$ and $G^{\prime}$ are said to be the isomorphic to each other if there is a one to one correspondence between their vertices and between their edges such that incidence relationship is preserved.

## Definition

A walk is defined as a finite alternating sequence of vertices and edges beginning and ending
with vertices such that each edge is incident with the vertices preceding and following it.

## Definition

A walk is closed if it has positive length and its origin and terminal are the same.

## Definition

A walk that is not closed is called on open walk.

## Definition

An open walk in which no vertex appears more than one is called path.

## Definition

The number of edges in a path is called length of a path.

## Example:

## Definition

A tree is a connected graph without any cycles.

## Example

## Result

A tree with $n$ - vertices has ( $\mathrm{n}-1$ ) edges.

## Definition

A closed walk in which no verte $x$ appears more than once is called a cycle.

## Result

A graph $G$ with n-vertices is called tree if $G$ is minimally connected graph.

## Definition: 1

A complete graph is sometimes also referred to as universal graph or clique.

## Example

## Definition

The size of the largest clique in $G$ is denoted by $W(G)$. In the above fig $W(G)=4$

## Definition

In connected graph $G$ the distance $d\left(v_{i}, v_{j}\right)$ of two of its vertices $v_{i}$ and $v_{j}$ is the length of the shortest path between them.

## Result

The graph $G$ with n - vertices is called tree if $G$ is minimally connected graph.

## Definition

The eccentricity $e(v)$ of the vertex $v$. In a graph $G$ is the distance from $v$ to the verte x farthest from $v$ in $G$.

## Definition

The diameter of the graph $G$ is defined as minimum eccentricity among all vertices of the graph.

## Example

The diameter of the graph $G$ is 4

## Definition

A grapy is said to be regular if all its vertices have the same degree otherwise it is called non regular.

## Definition

A set of vertices in graph is said to be an independent set if no two vertices in the set are adjacent.

## Example

$$
\left\{v_{1}, v_{2}, v_{3}, v_{4}\right\} \text { is independent set }
$$

## Definition

A maximal independent set is an independent set to which no other vertex can be added without destroying its independence property.

The set $\left\{v_{1}, v_{2}, v_{3}, v_{4}\right\}$ is maximu $m$ independent set in the above figure.

The set $\left\{v_{2}, v_{6}\right\}$ is another maximal independent set.

## Definition

The number of vertices in the maximal independent set of a graph of $G$ is called the independent number. It is denoted by $\beta(\mathrm{G})$.

## Example

Maximal independent set $=\left\{v_{2}, v_{5}\right\}$
Therefore $\beta(G)=2$

## Definition

$I(G)$ is the minimum cardinally of a maximum independent set of $G$.

## Example:

Maximal and minimal independent set therefore $\beta(G)=i(G)$

## Definition

A cut vertex of a graph is one vertex in $G$ whose removal increases the number of components.

Thus, if $v$ is a cut verte x of aconnected graph $G$, then $G-v$ is disconnected.

## Definition

A connected graph that has no cut - vertex is called block.

## Example

## Definition: 1.29

A complement $\bar{G}$ of a graph $G$ also has $V(G)$ as its point set. But two points are adjacent in $\bar{G}$ if and only if they are not adjacent in $G$.

## Example

$\mathbf{G}=K_{1,6}$

G

## Definition

Any complete bipartite graph of the form $\mathrm{k}_{1, \mathrm{n}}$ is called star graph.

## Example:

## Definition

Let $G=(V, E)$ be a graph, a set $D \subseteq V$ is a dominating set of $G$ is every vertex in $V-D$ is a adjacent to some vertex in $D$.

A dominating set is minimal if for any $v \in D, D$ - $\{V\}$ is not a dominating set of $G$.

## Example

If G is the following tree, than $\mathrm{D}=\left\{v_{2}, v_{13}, v_{6}\right.$, $\left.v_{7}, v_{10}, v_{15}\right\}$ is a dominating set.

A graph may have many dominating set of a graph need not have the same cardinality, the minimum cardinality of a dominating set of a graph G is said to be dominating number of G and denoted by $\gamma(\mathrm{G})$. (ie) $\gamma(\mathrm{G})=\{|\mathrm{G}|: \mathrm{G}$ is domination set of G\}

## Definition

The number of vertices in a minimum covering of $G$ is the covering number of $G$ and is denoted by $\beta(G)$.

## Definition

Let $G=(V, E)$ and let $S \subset V$ a vertex $v \in S$ is called and enclave of S . if $N[v] \subset S$ and $v \in \mathrm{~S}$ is called and isolated of S . If $N[v] \subseteq V-S$ a set is said to be enclave less if $S$ has no enclaves.

## Definition

A dominating set of a graph $G$ with minimum cardinality is called minimum dominating set and the cardinality of a minimum dominating set is called the dominating number of G is called the dominating by $\gamma(\mathrm{G})$.

## The Cobondage Number of a Graph Definition

The graphs considered here are finite, undirected without loops and multiple edges having p vertices and q edges. $\lceil X\rceil$ is a least integer not less than $X$. Graphs considered maximum degree at most $p-2$.

A set $D$ of vertices in a graph $G=(V, E)$ is an dominating set of $G$ if every vertex in $V-D$ is adjacent to some vertex in D . The domination number $\gamma(\mathrm{G})$ of G is the minimum cardinality of a dominating set. For a survey of results on domination.

The co bondage number $b_{c}(G)$ of a graph $G$ is the minimum cardinality among the set of edges $X \subseteq$ $\mathrm{P} 2(\mathrm{~V})-\mathrm{E} 2$, where $\mathrm{P} 2(\mathrm{~V})=\{\mathrm{X} \subseteq \mathrm{V}:|\mathrm{X}|=2\}$ such that $\mathrm{y}(\mathrm{G}+\mathrm{X})<\gamma(\mathrm{G})$.

## Theorem

For any graph G,

1. $\mathrm{b}_{\mathrm{c}}(\bar{G}) \leq \delta(\mathrm{G})$

Where $\bar{G}$ and $\delta(\bar{G})$ are the complement and minimum degree of $G$ respectively.

## Corollary

For any graph $G$.
2. $\mathrm{b}_{\mathrm{c}}(\bar{G}) \leq \mathrm{p}-1 \Delta$ (G)

Where $\Delta(\mathrm{G})$ is the maximum degree of G .

Now we obtain the exact values of $\mathrm{b}_{\mathrm{c}}(G)$ for some standard graphs. Proposition 2. If $\mathrm{G}=\boldsymbol{K}_{\boldsymbol{n} 1, n 2 \ldots, \ldots n}$, where $\mathrm{n} 1 \leq n 2 \leq \ldots \leq \mathrm{nt}$, then,
3. $\mathrm{b}_{\mathrm{c}}(\mathrm{G})=\mathrm{n}_{1}-1$.

## Proof

let $\mathrm{V}=\mathrm{V}_{\mathrm{n} 1} \cup \mathrm{~V}_{\mathrm{n} 2} \mathrm{U} \ldots \cup$ Vnt. Then for any two vertices $v \in V_{n 1}$ and $\omega \in \mathrm{V}_{\mathrm{nj}}$ for $2 \leq \mathrm{aj} \leq \mathrm{n}_{\mathrm{t}}\{\mathrm{v}, \mathrm{w}\}$ is a $\gamma$-set for $G$. since each $V n i$, for 1 ni nt , is independent with $\left|\mathrm{Vni}_{\mathrm{n}}\right| \geq 2$, by joining each verte x in $\mathrm{V}_{\mathrm{ni}}-\{v\}$ to v we obtain a graph which has $\{\mathrm{v}\}$ as a $\gamma$ set. This proves (3).

## Proposition

For any cycle Cp with p 4 vertices,
4. $\mathrm{b}_{\mathrm{c}}\left(\mathrm{C}_{\mathrm{p}}\right)=1$, if $\mathrm{p}=1(\bmod 3)$;
5. $=2$, if $\mathrm{p}=2(\bmod 3)$;
6. $=3$, other wise

## Proof

Let $\mathrm{C}_{\mathrm{p}}: \mathrm{v}_{1} \mathrm{v}_{2} \ldots \mathrm{v}_{\mathrm{p}} \mathrm{v}_{1}$ denote a cycle on $\mathrm{p} \geq 4$ vertices. We consider the following case.

## Case 1

If $\mathrm{p}=1(\bmod 3)$, then by joining by the vertex $v_{\mathrm{p}-1}$ to $v_{l}$, we obtain a graph $G$ which is a cycle $C_{\mathrm{p}-1}: \mathrm{v}_{1}$ $\mathrm{v}_{2} \ldots \mathrm{v}_{\mathrm{p}-1} \mathrm{v}_{1}$ together with a path $v_{p-1} v_{\mathrm{p}} v_{l}$ This inplies that,

$$
\begin{aligned}
& \boldsymbol{\gamma}(\mathrm{G})=\boldsymbol{\gamma}\left(C_{\mathrm{p}-1}\right) \\
& =\lceil(\mathbf{p}-\mathbf{1}) / \mathbf{3}\rceil<\lceil\mathbf{p} / \mathbf{3}\rceil=\boldsymbol{\gamma}\left(C_{\mathrm{p}}\right)
\end{aligned}
$$

This proves (4).

## Case 2

If $\mathrm{p}=2(\bmod 3)$, then by joining the vertices $v_{1}$ and $v_{\mathrm{p}}$ to $C_{p-2}$ the resulting graph G is a cycle $C_{p-2}$ $: v_{1} v_{2} \ldots \mathrm{v}_{p-2} \mathrm{v}_{1}$ together with a path $\mathrm{v}_{p-2} \mathrm{v}_{p-1} \mathrm{v}_{p} \mathrm{v}_{1}$ such that $\mathrm{v}_{p-2}$ is adjacent to $\mathrm{v}_{p}$ Thus

$$
\begin{aligned}
& \boldsymbol{\gamma}(\mathrm{G})=\boldsymbol{\gamma}\left(C_{\mathrm{p}-2}\right) \\
& =\lceil(\mathbf{p}-\mathbf{2}) / 3\rceil<\lceil\mathbf{p} / \mathbf{3}\rceil=\boldsymbol{\gamma}\left(C_{\mathrm{p}}\right)
\end{aligned}
$$

Hence (5) holds.

## Case 3

If $\mathrm{p}=3(\bmod 3)$, then by adding the edges $\boldsymbol{v}_{1} \boldsymbol{v}_{p-3}$, $v_{p} v_{p-3}, v_{p-1} v_{p-3}$ the resulting graph $G$ is cycle $\mathrm{c}_{p 3}: \boldsymbol{v}_{1}$ $v_{2} \ldots v_{p-3} v_{1}$ together with a path $v_{p-3} v_{p-2} v_{p-1} v_{p} v_{1}$ such that $\boldsymbol{v}_{p-3}$ is adjacent to both $\mathbf{v}_{\mathbf{p}-\mathbf{1}}$ and $\mathbf{v}_{\mathbf{p}}$. Hence,

$$
\begin{aligned}
& \boldsymbol{\gamma}(\mathrm{G})=\boldsymbol{\gamma}\left(C_{\mathrm{p}-2}\right) \\
& =\lceil(\mathbf{p}-3) / 3\rceil<\lceil\mathbf{p} / 3\rceil=\boldsymbol{\gamma}\left(C_{\mathrm{p}}\right)
\end{aligned}
$$

thus (6) holds.

## Proposition

For any path $\mathrm{P}_{\mathrm{p}}$ with $\mathrm{p} \geq 4$ vertices.
7. $\mathrm{b}_{\mathrm{c}}\left(\mathrm{P}_{\mathrm{P}}\right)=1$, if $\mathrm{p} \equiv \mathrm{l}(\bmod 3)$;
8. $=2$, if $\mathrm{p} \equiv 2(\bmod 3)$;
9. $=3$, if $\mathrm{p} \equiv 3(\bmod 3)$.

## Proof

Proofs (7), (8) and (9) are similar to that of proofs of (4),(5) and (6), respectively.

## Theorem

Let T be a tree with at least two cutvertices such that each cutvertex is adjacent to an end vertex. Then,
10. $\mathrm{b}_{\mathrm{c}}(\mathrm{T})=\mathrm{r}$
where $r$ is the minimum number of end vertices adjacent to a cut vertex.

## Proof

Let S be the set of all cut vertices of T . Then S is a $\gamma$ set for $T$. Let $u \in S$ be a cutvertex which is adjacent to minimum number of end vertices $\mathrm{u}_{1}, \mathrm{u}_{2}$, $\ldots, \mathrm{u}_{\mathrm{r}}$ to v the graph obtained has $\mathrm{S}-\{\mathrm{u}\}$ as a $\gamma-$ set. This proves (10).

Now we obtain some more upper bounds on $b_{c}(G)$.

## Theorem

For any graph G.
11. $\mathrm{b}_{\mathrm{c}}(\mathrm{G}) \leq \Delta(\mathrm{G})+1$

Furthermore, the bound is attained if and only if every $\gamma$ - set D of G satisfying the following conditions.

D is independent
every vertex in D is of maximum degree
every vertex in V-D is adjacent to exactly one vertex in D .

## Proof:

Let D be a $\gamma$ - set of G . We consider the following cases.

## Case 1

Suppose $D$ is not independent. Then there exist two adjacent vertices, $u, v \in D$ Let $S \subset V-D$. Such that for each vertex $\omega \in \mathrm{S}, N\left(u_{1}\right) D=\{v\}$. Then by joining each vertex in $S$ to $u$, we see that $D-\{v\}$ is a $\gamma-$ set of the resulting graph.
Thus,
12. $\mathrm{b}_{\mathrm{c}}(\mathrm{G}) \leq|\mathrm{S}| \leq \Delta(\mathrm{G})-1$

## Case 2:

Suppose D is independent. Then each vertex $v \in$ $D$ is an isolated vertex in $\langle D\rangle$. Let $S$ be a set defined in Case 1. Since D has at least two vertices, by joining each vertex in $S U\{v\}$ to some vertex $\omega \in$ $\mathrm{D}\{v\}$, we obtain a graph which has $\mathrm{D}-\{v\}$ as a $\gamma-$ set Hence.
13. $\mathrm{b}_{\mathrm{c}}(\mathrm{G}) \leq|\mathrm{S} \cup\{v\}| \leq \Delta(\mathrm{G})+1$

The second part of the theorem directly follows from Cases 1 and 2.

## Corollary

For any graph G,
14. $\mathrm{b}_{\mathrm{c}}(\mathrm{G}) \leq \min \{\mathrm{p}-\mathrm{A}(\mathrm{G})-1, \Delta(\mathrm{G})+\mathrm{l})$

## Theorem

For any graph $G$.
11. $\mathrm{b}_{\mathrm{c}}(\mathrm{G}) \leq \mathrm{p}-1$

Further, the bound is attained if and only if $\mathrm{G}=\bar{K} 2$.

## Proof

Since $\Delta(\mathrm{G}) \leq \mathrm{p}-2$, (13), follow from (11).
Suppose the bound is attained. Then by (1), it follows that $\bar{G} \mathrm{Kp}$. Suppose $G$ has at least three vertices. Then $b_{c}(G)=1<p-1$, a contradiction. Th is implies that $\bar{G}=\mathrm{K}_{2}$ and hence $\mathrm{G}-\bar{K}_{2}$ Converse is immed iate.

The next result improve the inequality (13).

## Theorem

For any graph $G$ with $p \geq 3$ vertices.
15. $\mathrm{b}_{\mathrm{c}}(\mathrm{G}) \leq \mathrm{p}-2$

Further, the bound is attained if and only if $\mathrm{G}=2 \mathrm{~K}_{2}$ or $\bar{K}_{3}$ or $\mathrm{K}_{2} \cup \mathrm{~K}_{1}$.

## Proof

Suppose the bound is attained. Then $\Delta(\mathrm{G})=1$. Suppose $p \geq 5$. Then, $b_{c}(G) \leq p-3$, a contradiction. This implies that $\mathrm{p}=3$ or 4 . Forp $=3$, obviously $\mathrm{G}=$ $\bar{K}_{3} \operatorname{orK}_{\mathbf{2}} \cup \mathbf{K}_{\mathbf{1}}$. If $\mathrm{p}=4$ and G contains an isolate, then, $\mathrm{b}_{\mathrm{c}}(\mathrm{G})=1$, a contradiction. This proves that $G=\mathbf{2} \mathbf{K}_{\mathbf{2}}$. Converse is easy to prove.

The bondage number $b(G)$ of $G$ is the minimum cardinality among the sets of edges $X \subseteq E$ such that $\gamma(\mathrm{G}-\mathrm{X})>\gamma(\mathrm{G})$.

Theorem A (2), For any nontrivial tree T, b(T) $\leq 2$.

As a consequence of Theorem 6 and Theorem A, we have.

## Theorem

Let T be a tree with diam $(\mathrm{T})=5$ and has exactly two cut vertices which are adjacent to end vertices and further they have same degree. Then,
16. $\mathrm{b}_{\mathrm{c}}(\mathrm{T}) \geq \mathrm{b}(\mathrm{T})+1$
where diam $(T)$ is the diameter of $T$.

## Theorem

For any tree T,

$$
\mathrm{b}_{\mathrm{c}}(\mathrm{~T}) \leq 1+\min \{\operatorname{deg} u)
$$

where $u$ is a cut vertex adjacent to an end vertex.

## Proof

Since there exists a $\gamma$-set containing $u$, by applying same technique as we used in proving (11) we get (16).

The next result relates to $b_{c}(G)$ and $b_{c}(T)$.

## Theorem

Let T be a spanning tree of G such that $\gamma(\mathrm{T})=$ $\gamma(\mathrm{G})$. Then
17. $\mathrm{bc}(\mathrm{G}) \leq \mathrm{bc}(\mathrm{T})$.

## Proof

Let X be a $\mathrm{b}_{\mathrm{c}}$-set of T . Then exists a set $\mathrm{X}^{\prime} \subseteq \mathrm{X}$ such that $\gamma(\mathrm{G}-\mathrm{FX})<\gamma(\mathrm{G})$. This proves (17).

Now we obtain a relationship between $b_{c}(G)$ and $y(G)$.

## Theorem

For any graph G ,
18. $\mathrm{b}_{\mathrm{c}}(\mathrm{G})+\gamma(\mathrm{G}) \leq \mathrm{p}+1$.

Further, the equality holds if and only if $\mathrm{G}=\bar{K}_{P}$

## Proof

Let D be a $\gamma$-set of G . Let $v \in \mathrm{~V}$ - D . Then there exists a vertex $u \in D$ such that $v$ is adjacent to it. Since there exists a vertex $w \in D-\{u\}$.by joining the vertices of $((\mathrm{V}-\mathrm{D})-\{v\} \cup\{\omega)\}$ to u , we see that $\mathrm{D}-\{\mathrm{co}\}$ is a $\gamma-$ set of the result of graph. This proves (18). Now we prove the second part.

Suppose the equality holds. On the contrary, G $\neq \bar{K}_{P}$ Then by above. $\mathrm{b}_{\mathrm{c}}(\mathrm{G}) \leq \mathrm{p}-\gamma \quad(\mathrm{G}), \quad \mathrm{a}$ contradiction. This proves that $\mathrm{G}=\bar{K}_{P}$ Converse is obvious.

The next result sharpnes the inequality (18).

## Theorem

Let D be a $\gamma$ - set of G If there exists a vertex $v \in \mathrm{D}$ which is adjacent to every other vertex in D , then,
19. $\mathrm{b}_{\mathrm{c}}(\mathrm{G}) \leq \mathrm{p}-\gamma(\mathrm{G})-1$.

## Proof

This follows from (2), since $\Delta(\mathrm{G}) \geq \operatorname{deg} v \geq \gamma$ (G).

Lastly we obtain a Nordhaus - Gaddum type result.

## Theorem

Let $G$ be a graph with $p \geq 4$ vertices such that neither $\bar{G}$ nor $g$ is $2 \mathrm{~K}_{2}$. Then,
20. $\mathrm{b}_{\mathrm{c}}(\mathrm{G})+\mathrm{b}_{\mathrm{c}}(\overline{\boldsymbol{G}}) \leq 2(\mathrm{p}-3)$.

The equality holds if and only if $G=p 4$ or C 5 .

## Proof

Follows from Theorem 8.
Suppose the equality holds. Then, $\Delta(\mathrm{G}), \Delta(\bar{G})$ $\leq 2$.

Suppose $\Delta(\mathrm{G})$ or $\Delta(\bar{G})-1$. say $\mathrm{A}(\mathrm{G})=1$. Then, $\Delta(\bar{G})-\geq 3$, a contradiction. Hence, $\Delta(\mathrm{G})=\Delta(\bar{G})=$ 2. If $\mathrm{p} \geq 6$, then $\Delta(\bar{G}) \geq 3$, a contradiction. Thus, $\mathrm{p}=$ 4 or 5 . This implies that $G=\mathrm{p}_{4}$ or $\mathrm{C}_{5}$. Converse is easy to prove.
